

A World Leader in Add-ons for Outlook and Exchange

WebTeam Central Multi Domain

Add-On[®]
PRODUCTS

- how to share calendar information across different Exchange domains

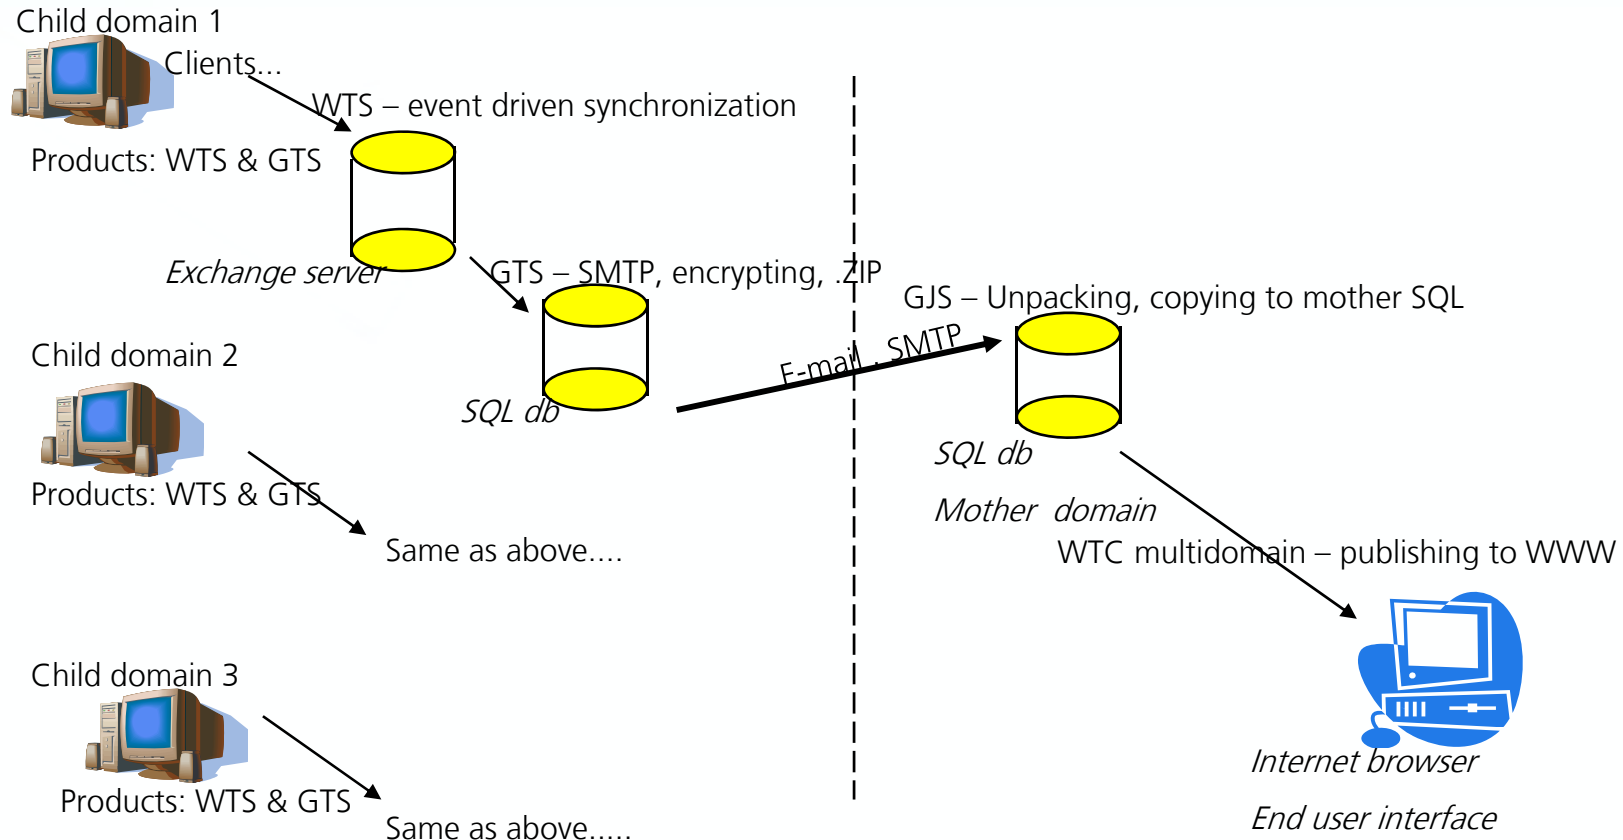

WebTeam Central – multi domain:

- **First product to integrate different Exchange domains and allow viewing of a multi domain based group calendar**
- **Strictly browser based application**
- **Based on the successful WebTeam Central (single domain) from Add-On Products**
- **Compatible with Exchange 5.5 and newer**
- **No firewall barriers as only SMTP traffic is used**
- **Unique architecture and performance**
- **Very scalable and easy to install**

WebTeam Central – multi domain:

- Several 'child domains' can now be synchronized into one group calendar. The individual Outlook user's calendar information stored on each Exchange server is the base of the information in the overall group calendar. This means that your users doesn't need to do anything differently than today to archive a general overview of the total sum of user or portions of these.
- The following slides graphically illustrates the flow of data from individual users in the different child domains, through to the end user needing to overview a set of calendars on the central 'mother' domain/the overall group calendar.

WebTeam Central – multi domain:

WebTeam Central – multi domain:

Component overview:

Child domains:

WTS (WebTeam Service) : – publishes data from Exchange to a SQL database

GTS (GlobalTeam Service): – Packs a .zip (or other suffix) file of the data from the SQL db and encrypts the file. Generates an email that is sent to the mother domain site (via. SMTP)

Components for a child

Component	Needs access to	Can be installed on
Web Team Service	Exchange Server; SQL Server	Exchange Server; SQL Server; Separate Server
Event Object and Registration Utility	Exchange Server	Exchange Server
Global Team Service	SQL Server	SQL Server; Separate Server

WebTeam Central – multi domain:

Component overview:

Mother domain:

GJS (Global Join Service): – unpacks the encrypted data from the email and stores the calendar information into the central SQL db

WTC (WebTeam Central - multi domain): – end user asp application that publishes data to the browser, thus bringing together the final group calendar view.

Components for mother domain

Component	Needs access to	Can be installed on
Global Join Service	Exchange Server (mailbox); SQL Server	SQL Server; Separate Server
WebTeam Central multidomain	SQL Server	IIS Server

WebTeam Central – multi domain:
